Guidelines for Booklet

- This catalog lists products as of August 2019.
 - Please note that specifications of the products listed in this catalog may be changed without notice due to continuous research & development and product improvements.
 - This catalog contains the major features and relevant information on all of our products. Please contact our sales representatives or dealers if more detailed information is needed.
 - Stock Status Symbols
 - : Standard stock available for Right-Hand, Left-Hand and neutral products
 - R : Stock available only in Right-Hand
 - L : Stock available only in Left-Hand
 - : 1-2 weeks delivery
 - Ⓜ : 1-2 weeks delivery only in Right-Hand
 - Ⓛ : 1-2 weeks delivery only in Left-Hand
 - : While stock lasts
 - No symbol : Not stocked
- } Non-returnable items
- Please note that this catalog was prepared based on products intended mainly for sale in North and South America.

■ Standard

1) Holder Type	Package quantity	Notes
Turning holder	1 pc/case	
Milling cutter	1 pc/case	
2) Spare parts	Package quantity	Notes
Screw	10 pcs/case	Clamp screw, Clamp bolt, Double screw, Button screw
Seat	10 pcs/case	Shim seat
Clamp	10 pcs/case	Clamp
Wrench and cutter parts (such as cartridges)	5 pcs/case	Wrench, bit, cutter product
Blade	1 pc/case	
Handle, Hose	1 pc/case	Handle with magnet, handle and bit
3) Insert Type	Package quantity	Notes
BIDEMICS (Brazed)	1 pc/case	JP2
End mill	1 pc/case	SX9 Ceramic end mill
CBN	1 pc/case	B23, B30, B36, B40, B52, B5K, B6K, B99
PCD, Diamond coating	1 pc/case	PD1, PD2, UC1
CTPW insert for cut-off	5 pcs/case	CTPW series
STICK DUO Solid carbide bar	1 pc/case	SHFS, SHFB, SBFS, SBFB, SBB, SBG, SBT, SSP
All others	10 pcs/case	

*Packaging may vary depending on the product size.

Guidelines for Machining HRSA Materials

Guidelines for Insert Selection

High ← **Strength** → Low

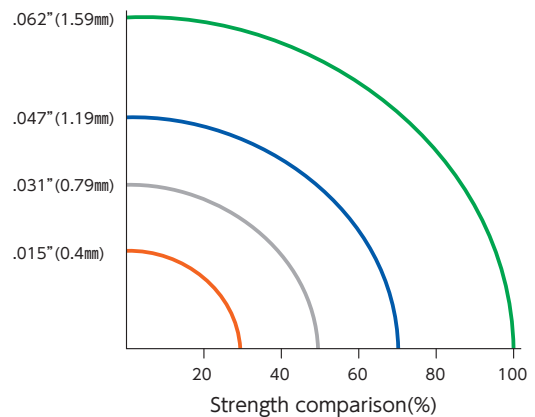

High ← **Productivity & Radial forces** → Low

Insert Thickness

Insert Nose Radius Inches

For the best performance always use the strongest possible insert shape to maximize corner strength and productivity. If the operation allows, it is best to use round inserts or square inserts with a large nose radius and a small entering angle.

Use the largest nose radius possible for the operation, so you increase the strength of the insert which will result in better tool life but remember that this will result in increased tool pressure.

Larger insert thickness gives added strength and integrity during machining offering far better impact resistance, heat dispersion, and longer tool life. This results in higher productivity.

■ Edge Conditions are a Key to Success

An important factor for achieving success when machining with ceramic inserts is to use the correct edge preparation. Ceramic is a hard material therefore the insert needs some edge work in order to withstand cutting forces and optimize the cutting tool performance. The edge preparation must correspond to the ceramic grade selected, the type of HRSA material being machined and the machining operation being performed. The majority of ceramic applications can be handled with NTK's standard edge preparations.

In unique circumstances that may arise, an edge preparation may need to be specialized to meet the conditions.

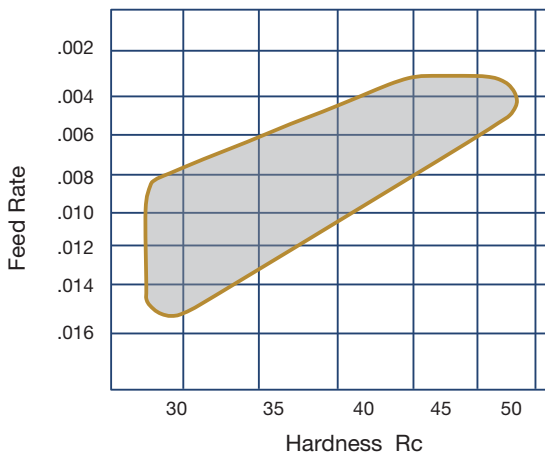

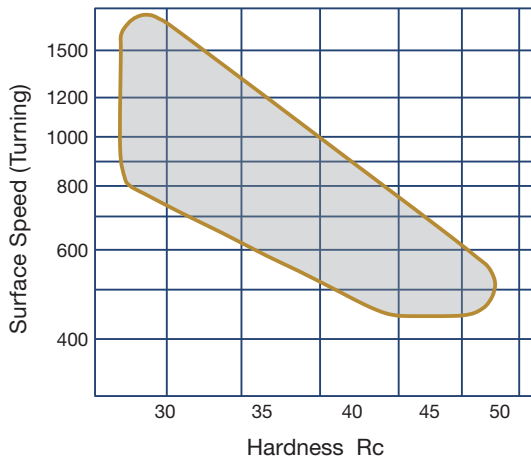

The chart below describes standard edge preps.

■ Description of Insert Edge Preparations

<p>Edge Strength Increases</p>	<p>FNX Style</p>	<p>Up sharp edges are not recommended for ceramics.</p>
	<p>E Style</p>	<p>Hones help protect the edge of ceramics from chipping or fracturing. Feed rates must be greater than the hone size to prevent a rubbing rather than a cutting action. Excessive honing reduces tool life.</p>
	<p>T Style</p>	<p>This geometry is typically the most common ceramic edge preparation. The cutting forces are distributed over a concentrated area of the ceramic edge.</p>
	<p>Z & S Style</p>	<p>A hone added to a T-land provides a stronger edge to prevent chipping. Usually this type of geometry works best on interrupted cuts or turning hardened steels.</p>
	<p>J, P & Q Style</p>	<p>Double T-lands and hones are generally used in heavy roughing cuts or hardened materials. This edge is extremely shock resistant but also generates large cutting forces.</p>

Guidelines for Machining HRSA Materials

Know the Workpiece Material to Determine Parameters

To effectively machine with ceramic inserts it is important to factor in the physical hardness of the material and the surface condition to determine the starting speed and feed. The chart information is based on using an RNG 45 insert with a depth of cut from .125 inches or less. In rough / scale conditions, use the lower side of the speed range for the hardness of the material. If machining clean HRSA material use the higher speed range based on the hardness. When using weaker geometry inserts such as triangles it is important to reduce feeds.

The formation of the chip is a good indicator of the material hardness, the chips will break easily. The cutting temperatures will be higher with hardened materials resulting in more notch wear on the insert edge.

Softer HRSA materials machine similar to stainless steels. Insert grades with greater toughness and reduced hot hardness resistance are ideal in these conditions due to reduced machining temperatures and an increase of the chip breaking against the insert.

Parts that have a forged scale work surface, typically machined in soft state around 26 Rc, require a 25% speed reduction and an increase of the feed until the scale is gone. When cutting cast HRSA material speeds can be increased from those indicated on the graph and it is recommended to reduce feeds to one half of the value indicated on the chart. The maximum depth of cut should be around .060" (for an RNG45) and use flood coolant conditions where applicable. Bar stock is the easiest to machine allowing the use of harder more wear resistant insert grades than when machining forgings.

Material	Components	Advantage	Machinability
Forging	Large	High strength	Medium
Casting	Complex shapes	Low strength	Poor
Bar Stock	Less than 7.5" dia.	Availability/strength	good

Guidelines for Machining Heat Resistant Alloy

Rough

Same Depth of Cut

Note)
Notch wear on the insert cutting edge as shown in is the result of multiple passes being taken at the same depth of cut. This type of wear will minimize tool life. The following programming examples will help to minimize this mode of failure.

change to

Varying Depth of Cut

Note) Another programming change that may help to reduce notching is by varying the depth of cut. Again, the same principle applies, notching takes place at various points on the cutting edge rather than concentrated at one point.

Ramping

Note) Programming " Ramping " cuts in the same cutting direction is one of the best procedures to use to minimize notching. By varying the DOC, wear is distributed over the entire cutting edge not on one point.

Repeated passes with same depth of cut

This is not a beneficial practice because the insert will develop severe notching at the point of the repetition of DOC. This will result in indexing the insert often. For this reason it is best to vary the depth of cut point by utilizing one of two techniques.

Vary the Depth of cut through multiple passes.

Gradually reduce the depth of cut with every pass. This may increase the operation time slightly but will result in longer tool life for the insert and less indexing of the insert.

Multiple passes using ramping programming

This technique has a proven benefit to roughing operations. Gradually feed out while traversing the part will result in significant reductions in notching. The subsequent pass is programmed at a constant cut since the surface is now ramped.

Depth of Cut and Tool Life

Insert failure due to depth of cut notching is a typical result when machining heat resistant alloys and must be controlled to prevent a catastrophic failure of the cutting edge. The depth of cut is a key consideration during the machining operation to maximize tool life and minimize notch wear on the cutting edge. A decrease in the lead angle results in increased cutting forces on the insert edge. As the DOC exceeds beyond the point on the insert edge where a 45 degree line from the center of the insert intersects the cutting edge the greater the notch wear and the increased risk for failure of the insert edge. There is a direct relationship between the insert radius size and the maximum depth of cut (at around 60 deg. mark) which should be taken. See the chart below for recommendations.

Any increase in DOC requires a reduction of the speed and feed rates. Parameters are based on the ceramic insert's ability to withstand high temperatures and run with a chip thickness that allows the heat to be concentrated in the zone ahead of the insert resulting in low cutting pressure and minimal wear. If the speed is reduced without a corresponding reduction in feed, this effect will be lost and the performance will fall off due to chipping of the insert edge from a cooler chip.

Speed and Feed Rate (%) vs. Depth of Cut on the Radius

Insert Radius Inches (mm)	Ideal DOC Inches (mm)	Insert Descriptions
.125 (3.18)	.038 (0.93)	RCGX / RPGX23; RPG21..
.187 (4.76)	.056 (1.40)	RCGX / RPGX35; RNG / RPG32
.250 (6.35)	.075 (1.86)	RCGX / RPGX45; RNG43 / 45; RPG 43
.312 (7.94)	.092 (2.33)	RNG55
.375 (9.53)	.110 (2.79)	RNG64 / 65; RPG65
.50 (12.70)	.147 (3.72)	RNG85 / 86

Guidelines for Machining Heat Resistant Alloy

Depth of Cut Recommendation based on Insert Corner Radius

To maximize tool life when using straight-edged inserts (C, D, or S) with corner radii, as opposed to a round insert, the allowable depths of cut are related to the radius and not the insert size. To minimize notching and allow a cut from both directions, the effective machining procedure is to take more material off during the roughing operation, with a round insert. Then the material removal amount for the finishing operation, with a straight edge insert, should be suitable for the nose radius of the insert.

It is important to choose the insert with the appropriate corner radius to complete the finishing operation's depth of cut. If the part has a required radius feature called out, then do not leave more than the amount of material called out for the required insert radius to finish the part and feature. A large corner radius may deflect a part with thin walls because of radial forces generated between the workpiece and insert.

Insert Corner Radius Inch (mm)	Ideal Depth of Cut Inch (mm)	Corner Radius Designation Inch (mm)
.015 (0.38)	.0046 (0.12)	1 (04)
.031 (0.80)	.0092 (0.23)	2 (08)
.048 (1.21)	.0139 (0.35)	3 (12)
.063 (1.59)	.0183 (0.47)	4 (16)
.094 (2.38)	.0275 (0.70)	6 (24)
.125 (3.18)	.0370 (0.93)	8 (32)

Optimum DOC is 5-15% of insert diameter (based on 0 deg. Lead angle)

As seen in these photos, by removing the appropriate amount of stock for the nose radius of the insert and staying below the 45° mark of the corner radius notching is minimized allowing a cutting operation to be programmed from both directions on the insert.

Lead Angles

When cutting heat resistant alloys consideration should be given to using the largest lead angle possible. A large lead angle allows the cutting forces to be spread over a larger surface area of the insert. This will also improve tool life and surface finish while reducing notching. As the lead angle increases the chip will flow more easily.

Feed

Surface finish is directly related to the insert nose radius and the feed rate programmed. The larger the radius on the insert the faster the tool can be fed to achieve the appropriate finish. When machining HRSA materials with SiAlON ceramics utilize their superior strength by increasing the feed rate which will minimize wear and cutting time.

Typical insert wear pattern showing the effect of various lead angle changes and the resulting increase of depth of cut notching

Milling Operations on Heat Resistant Alloys (High Nickel)

Button inserts in a milling cutter rotate in and out of the cut during a revolution this reaction on the insert edge is comparable to machining an interrupted cut on a turning operation. This rotation in and out of the material also can hinder achieving the desired temperature ahead of the tool. So, an increase in speed, reduced feed/tooth in order or a combination will help generate the heat. It is recommended to use climb milling techniques to avoid elevated temperatures in a thin area of the chip which could create chip welding and re-cutting of the chip which reduces tool life.

Increase speeds from turning recommendations in chart according to width of cut. Reduce the feed rate recommendations for turning in chart by about 50% (This is feed per tooth, not per revolution of the cutter)

The width of the cut has a direct relationship to the temperature generated ahead of the inserts. As the width is decreased the temperature decreases because the insert is out of the cut more than in the cut. The chart below shows the percentage to increase speeds given in the previous chart for various widths of cut. The widths are also expressed as percentages of the cutter diameter (so all cutter sizes apply)

A milling insert can only be cutting 50% of each revolution if the path of cut is equal to the cutter diameter. So, it will always be necessary to increase speed and reduce feed compared to the turning recommendations to achieve the temperatures needed.

Width of cut in % of cutter diameter engaged	Surface speed in % of Graph
100%	125%
90%	150%
80%	220%
70%	280%
60%	340%
50%	400%
40%	460%

■ Minimize overhang

Too much overhang causes the holder to deflect resulting in vibration and chatter which is damaging to ceramic inserts and can lead to insert breakage. When working with turret style machines, straight edged inserts should be considered in place of round inserts. The straight edge eliminates radial tool forces and chatter issues.

■ Pre-chamfering

Pre-chamfering the part reduces the potential for insert chipping or breaking upon the entry or exit point of work material. To effectively complete a pre-chamfer operation it is important to program the feed at a 90 degree angle to the chamfer in order to prevent notching and increase insert tool life.

■ No dwelling

Inserts wear out when rubbing the part instead of cutting

■ Coolant

When turning with BIDE MICS, SiALON and Whisker a flood coolant condition should be used. In some cases where a high interruption is encountered it may be best to shut off the coolant. No coolant should be used while milling with SX3, SX7 and SX9.

■ Edge preparations

Typical HRSA machining requires the insert cutting edge to be sharp. Using a slight T-land or honed edge is also effective to reduce notching, flaking and built up edge.

Guidelines for Machining HRSA Materials

Troubleshooting

Cutting Conditions & Parameters Adjustment

		Cutting speed (SFM)		Feed rate (IPR)		Grade attribute		
		SIALON	BIDEMICS	SIALON	BIDEMICS	BIDEMICS	SIALON	Whisker

Heat		➔	➔	➔	➔	—	—	—
Chatter		➔	➔	➔	➔	—	—	—

● 1st Choice ● 2nd Choice

Test Results

[a] **WA1** : Increase cutting speed

[b] **SX7 • SX3 • SX9 • SX5** : Increase feed rate

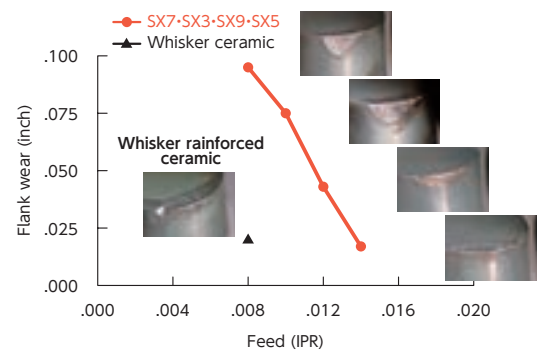

[c] **SX7 • SX3 • SX9 • SX5** : Decrease cutting speed

Note : Speed and feed rates shown are recorded test data and should not be thought of as recommended cutting conditions.

[d] **SX7 • SX3 • SX9 • SX5** : Increase feed rate

Feed rate increased decreases wear amount of SIALON

Cutting condition
Work material : Inco718 Cutting Speed : 800 SFM
Insert shape : RNG45 Depth of Cut : .080"
WET

In some cases, in order to increase the wear resistance of **SX7 & SX3 & SX9 & SX5**, the feed must be increased. By increasing the feed and utilizing the toughness of **SX7 & SX3 & SX9 & SX5**, the inserts are off the part sooner causing less wear. Increasing the feed also decreases cycle time and improves productivity and profitability.

Note : Be careful to reduce the feed rate by 25%, when going into a corner.

Grade Recommendations based on Material's Machinability and Application

Formula for Turning

Calculating the cutting speed

Calculating the cutting speed from the rotation speed

$$v_c = \frac{\pi \times D_m \times n}{12}$$

(SFM)

v_c : Cutting speed (SFM)
 D_m : Machining diameter (inch)
 n : Spindle speed (rpm)
 π : Pi (3.14)

Calculating the revolution speed from the cutting speed

$$n = \frac{12 \times v_c}{\pi \times D_m}$$

(rpm)

Calculating the cutting time

Calculating the cutting time for OD (ID) machining

$$T = \frac{l}{f \times n}$$

(min)

T : Cutting time (min)
 l : Cutting length (inch)
 f : Feed rate (IPR)
 n : Spindle speed (rpm)

Calculating the cutting time for facing

$$T = \frac{\pi \times (a^2 - b^2)}{4000 \times v_c \times f}$$

(min)

T : Cutting time (min)
 v_c : Cutting speed (m/min)
 f : Feed amount (mm/rev)
 π : Pi (3.14)

Calculating the theoretical surface roughness

$$h = \frac{f^2}{8 r_e} \times 1000^2$$

(μinch)

h : Theoretical surface roughness (μinch)
 f : Feed amount (IPR)
 r_e : Corner radius (inch)

[Guidelines for actually finished surface roughness]
 Steel type work: Theoretical surface roughness × 1.5 to 3
 Cast iron type work: Theoretical surface roughness × 3 to 5

Formula for Milling

Calculating the cutting speed

Calculating the cutting speed from the rotation speed

$$v_c = \frac{\pi \times D_c \times n}{12}$$

(SFM)

Calculating the revolution speed from the cutting speed

$$n = \frac{12 \times v_c}{\pi \times D_c}$$

(rpm)

v_c : Cutting speed (SFM)
 D_c : Cutter diameter (inch)
 n : Spindle speed (rpm)
 π : Pi (3.14)

Calculating the feeding speed and feed rate

Calculating the feed rate per blade

$$f_z = \frac{v_f}{z \times n}$$

(IPT)

Calculating the feeding speed per minute

$$v_f = f_z \times z \times n$$

(inch/min)

f_z : Inch amount per tooth (IPT)
 v_f : Table feed (inch/min)
 z : Number of tooth
 n : Spindle speed (rpm)

Calculating the machining time

$$T = \frac{L}{v_f}$$

(min)

T : Cutting time (min)
 L : Total length of table feed
 ($l + D_c$)
 v_f : Table feed (inch/min)

Machining HRSA Materials with BIDE MICS and Ceramics

Solutions for the Aerospace & Energy Industries

BIDE MICS - Game Changer

- 1600SFM Capability
- Double tool life at whisker's speed range

JX1

■ Features

- Up to 1600 SFM speed capability
- Much longer tool life at Whisker ceramics' speed range
- Superior surface finish vs. Whisker ceramics

■ Work Materials

- Inco 718 • 718 Plus
- Powdered metal
- Inco 625 • Rene

JP2

■ Features

- 10 to 15x speed capability vs. carbide
- Better wear resistance and notching resistance than CBNs
- Superior surface finish to Carbide or CBN

■ Work Materials

- Inco 718 • 718 Plus
- Powdered metal • Inco 625 • Rene

SX7

■ Features

- Can run at same cutting condition as whisker ceramics
- Best grade for high-speed milling

■ Work Materials

- Inco 718 • Inco 625
- Waspaloy • Udimet 720

SX3

■ Features

- Excellent wear resistance and toughness. Wide range of HRSA machining applications: Roughing with scale - semi finishing turning.
- Able to machine even the newest generation of HRSA work materials (like Rene) as well as most common HRSA materials; such as Inconel 718.

■ Work Materials

- Inco 718 • 718 Plus
- Powdered metal • Inco 625
- Rene

SiAlON - Workhorse

- Durable for scale to semi-finish machining

JX3

■ Features

- Added toughness in BIDE MICS
- Same speed capability as JX1

■ Work Materials

- Inco 718 • 718 Plus • Powdered metal
- Inco 625 • Rene

WA1

■ Features

- Better flank wear resistance compared to SiALON ceramics
- Better notching resistance compared to competitor's whisker ceramics

■ Work Materials

- Inco 718 • Inco 625

Whisker - Versatile Player

- Productivity and reliability

SX5

■ Features

- Best grade for scale and interruptions
- Best grade for machining high-cobalt alloys

■ Work Materials

- Waspaloy • Udimet 720
- 718 Plus • Rene 41

SX9

■ Features

- Extreme toughness makes higher feed and heavier DOC machining possible
- Best grade for machining Inco 718 with scale

■ Work Materials

- Inco 718 • Inco 706
- Inco 713 • Rene

JX1/JX3 NEW

Features

- Significantly extended tool life compared to whisker ceramics
- Double cutting speed potential compared to whisker ceramics
- Superior surface finish compared to whisker ceramics
- Applicable to powder-metallurgical heat resistant alloys
- Newly added JX3 provides toughness to BIDEMICS family

Patented

Increase Productivity vs. Whisker Ceramics

① Significantly extended tool life at same speed

② Double speed capability

JP2

Features

- High speed finish turning can be performed at 800SFM or higher
- Superior wear resistance compared to CBN's
- Superior notching resistance vs CBN or carbides
- Superior surface finishes vs CBNs and coated carbides

Patented

Increase Productivity vs. Carbide

① 10 to 15 times higher speed capability

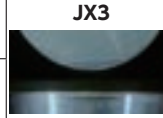

Grade	Work material	Application	Purpose	Cutting speed (SFM)	Feed (IPR)	Depth of cut (inch)	DRY	WET
JX1	Heat Resistant Alloy	Turning	Rough no scale	600- 1600	.005-.011	.040-.100		●
			Semi finishing	600- 1600	.004-.010	.020-.080		●
JX3	Heat Resistant Alloy	Grooving	Rough no scale	600- 1600	.002-.005	—		●
JP2		Turning	Finishing	600- 1700	.002-.007	.005-.030		●

1 Higher Speeds, More Productivity

JX1/JX3's superior physical properties compared to Whisker ceramic enable you to increase speeds; potentially as much as 2X Whisker ceramic speeds; increasing productivity and potentially offsetting the need for additional equipment to meet increasing demands.

Chips break easily at higher cutting speeds vs the typically continuous chips of HRSA materials. The result is more efficient chip removal.

LPT disc (Inco718)		
	Comp. Whisker	JX3
Shape	RPGX45	←
Cutting speed (SFM)	700	1200
Feed (IPR)	.006	←
Depth of cut (inch)	.070	←
	WET	←
NTK : JX3	100 cc/min	
Competitor's Whisker ceramic	60 cc/min	

• JX3 cut 1.7 times faster than competitor's whisker and kept good edge.

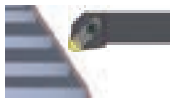

Disk (Inco718 Finishing)		
	Competitor's Coated Carbide	JP2
Shape	CNGG432	CNGA432
Cutting speed (SFM)	70	800
Feed (IPR)	.003	←
Depth of cut (inch)	.010	←
	WET	←
Tool life	1pc	←
NTK : JP2	525 cc/min	
Competitor's Coated Carbide	45 cc/min	

2 Longer tool life

JX1/JX3's combination of High Hardness, Superior Thermal Conductivity and Improved Strength compared to Whisker ceramics results in significantly longer tool life when applied at typical Whisker ceramic speeds, feeds, and depth of cut.

Turbine case (718 Plus semi finish)		
	Comp. coated Whisker	JX1
Shape	RNG45	←
Cutting speed (SFM)	800	←
Feed (IPR)	.010	←
Depth of cut (inch)	.020	←
	WET	←
NTK : JX1	3 pass	
Competitor's Whisker ceramic	1 pass	

• JX1 produced 3 times longer tool life than coated Whisker ceramic on difficult to cut material, 718 Plus.

Ring (Inco625 Finishing)		
	Comp. Whisker	JP2
Shape	CNGA433	←
Cutting speed (SFM)	1100	1400
Feed (IPR)	.008	←
Depth of cut (inch)	.012	←
	WET	←
NTK : JP2	20 pcs/corner with 27% higher productivity	
Competitor's Whisker ceramic	13 pcs/corner	

• JP2 got both better productivity and tool life over Competitor's Whisker.

3 Works well on wide range of High Temperature Alloys

BIDEMICS has success on

Inconel 718
Inconel 625

- 718 Plus
- Rene41
- Rene88
- Rene104
- Waspaloy

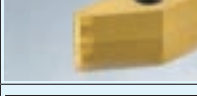

etc.

5 Speed up grooving operations

VGW style grooving inserts are now available

4 Superior surface finish

	JP2	CBN	Carbide
Machined surface			
Roughness			
Ra	0.64 μm	1.18 μm	2.75 μm
Rz	3.36 μm	5.56 μm	9.64 μm
Cutting speed	800 SFM	←	120 SFM
Feed rate	.006 IPR	←	←
Cycle time	3.3 min	←	14.7 min
Removed chip	48 cc	←	←

JP2's outstanding Wear Resistance and Notching Resistance results in work piece surface finishes consistently superior to either CBN or Carbide

SiALON Ceramics

- SiALON ceramic is a silicon nitride based ceramic combined with "Al" and "O". SiALON ceramic offers excellent heat resistance, mechanical strength under high temperature, thermal shock resistance and wear resistance in addition to the toughness of silicon nitride. SiALON shows superb performance in high speed machining of high temperature alloys.

NEW SX3

Best balance of toughness and wear resistance

Rough turning (Rene 130) with Scale		
SNG656	Competitor's SiALON Ceramic	SX3
380 SFM		
.006 IPR		
Various DOC		
WET		
NTK : SX3	10 min	
Competitor's SiALON	10 min • Was chipping a lot	

Features

- Excellent wear resistance and toughness.
Wide range of HRSA machining applications: Rough turning with scale ~ semi-finish turning.
- Able to machine even the newest generation of HRSA work materials (like Rene) as well as today's most common HRSA materials; such as Inconel 718.
- Able to mill with high efficiency.

Grade	Work material	Application	Purpose	Cutting speed (SFM)	Feed (IPR / IPT)	Depth of cut (inch)	DRY	WET

		Milling	-	2000-4000	.004-.006	.040-.100	●	

SX7

Wear resistant SiAlON ceramic

Features

- **Better notching resistance compared to Whisker ceramics**
No need to program ramping
- **Better flank wear resistance compared to other SiAlON ceramics**
Superior performance vs. whisker ceramics under same conditions-even higher productivity at higher feed rates
- **Excellent thermal shock resistance**
High speed milling can be performed at 3000SFM or higher

Whisker-reinforced ceramics

WA1 ceramic grade has a unique combination of superior wear resistance, toughness and flaking resistance as a result of adding SiC Whiskers to Alumina. WA1 is primarily used in machining continuous cuts of aerospace alloys because of its productivity and reliability characteristics. WA1 can also be used to machine gray cast iron and hardened steels because of its excellent thermal shock resistance.

UL Chipbreaker Features:

- First negative style insert designed for Swiss machines
- Less tool pressure which reduces the heat generated leading to a more efficient cut and longer tool life
- Good chip control

Chipbreaker- Chip Control Range

MEMO

Grooving / Side Turning Tools

Guideline for grooving HRSA materials

BIDEMICS / Ceramic grooving inserts provide high speed capability to your process. Whisker ceramic is the most versatile option in this category. NTK also offers BIDEMICS and SIALON grades for more productivity and stability.

	JX1	JX3	SX3	SX7	SX5	WA1
Speed	●		●		●	●
Feed	●		●		●	●
Versatility	●		●		●	●
Toughness	●		●		●	●
	Can run at up to 1500 SFM. Double the speed of whisker		Double the feed of whisker		Best for Scale and interruption	Versatile grade

● : 1st choice ● : 2nd choice

Application	Grade	Work material	Cutting speed					Feed					Depth of cut					Coolant
			600	800	1000	1200	1400	1600	.004	.008	.012	.016	.020	.020	.040	.060	.080	
Grooving 	JX1 JX3	Overall	1200 (600-1600) SFM					.003 (.002-.004) IPR					<div style="border: 2px solid orange; padding: 5px; display: inline-block;"> When using SX7/SX5, increase feed rates 100% vs. Whisker Ceramics </div>					WET
	SX5	Waspaloy	700 (600-800) SFM					.006 (.003-.007) IPR										
	SX3 SX7	Overall	750 (600-900) SFM					.0045 (.003-.006) IPR										
	WA1	Overall	800 (600-1100) SFM					.003 (.002-.004) IPR										

Application	Grade	Work material	Cutting speed					Feed					Depth of cut					Coolant
			100	150	200	250	300	350	.001	.002	.005	.010	.015	.020	.040	.060	.080	
Finishing 	DM4 QM3 ZM3	HRSA	75-225 SFM					.002-.014 IPR					Width: .118-.157" Feed .002 - .006" Width: .157-.197" Feed .004 - .008" Width: > .197" Feed .006 - .014"					WET

When applying JX1/JX3, increase speed to over **1000 SFM**
 When applying SX3/SX7/SX5, increase feed rates **100%** vs. Whisker Ceramics

Application Information

Work Hardening Layer
 $\ge 45^\circ$

When machining a grooved area with multiple passes, the insert radius engages a potentially work hardened area during the last remaining plunge. This programming procedure sets up the potential of corner radius chipping or notching.

Change to

45°

The grooving insert is plunged down both outside walls thus maintaining a good finish. The remaining material can be removed by using a stronger insert shape such as a RCGX style.

Groove Duo Blade - Carbide Face Grooving Tool -

Unique S-shape design

Features

- **New GT Chipbreaker designed for face-grooving**
- **The best rigidity in a Modular system**
- **Excellent chip-control and great finish**

Excellent Chip Control

Grooving

- Excellent chip control and superior surface finish
- Good chip control without a peck cycle

	NTK:GT chipbreaker	Competitor
Chip		 Tangled chips during deep grooving
Surface finish		 Scratches inside bottom

Material : 4130, 450SFM, .004IPR, 2"diameter, .040depth, No step feed, WET
 Insert : GWPFM500N04-GT DM4 Holder : GBWPFPR-5T15-050120

Side-turning

- Excellent chip control for side-turning process
- Shiny surface finish

Grooving / Side Turning Tools

Combination of toolholder and blade for Face Grooving

GTWP-H

Straight style toolholder

Right-hand system

Clockwise rotation (M4 command)

Toolholder

GTWP **R-H**

* Right-hand toolholder takes Right-hand blade.

Blade

GBWPF **R**

Left-hand system

Counter clockwise rotation (M3 command)

Toolholder

GTWP **L-H**

* Left-hand toolholder takes Left-hand blade.

Blade

GBWPF **L**

GKWP-H

L-style toolholder

Right-hand system

Counter clockwise rotation (M3 command)

Toolholder

GKWP **R-H**

* Right-hand toolholder takes Left-hand blade.

Blade

GBWPF **L**

Left-hand system

Clockwise rotation (M4 command)

Toolholder

GKWP **L-H**

* Left-hand toolholder takes Right-hand blade.

Blade

GBWPF **R**

Rotating Tools

NEW Solid Ceramic End Mill

Features

- Extremely high speed machining for HRSA materials with our durable SiAlON grade "SX9"
- More than 15 times higher productivity than a Carbide end mill
- 4, 6 and 8 flutes are available
- Unique patent pending design provides toughness to the edge

RCE for HRSA materials

Ceramic specialist's design

Helix angle

- Designed for the purpose of:
 - 4-flute: toughness
 - 6-flute: less tool pressure and better chip evacuation

SX9(SiAlON)
 • Well balanced for toughness and wear resistance

Bottom edge

- Unique shape provides toughness

Flute

- Optimized for HRSA materials
- Excellent toughness

	SX9	Carbide
SFM	1970	130
IPT	.0012	←
DOC	.118	←

RCS for Cast iron / HRSA materials

Helix angle

- Designed for the purpose of:
 - 4-flute: toughness
 - 6/8-flute: less tool pressure and better chip evacuation

Flute
 • Three flute options up to 8 flute

End Gash

- Bigger end gash brings toughness

Edge

- Added chamfer provides toughness for cast iron machining

	SX9	Carbide

For Maximum Productivity

- A continuous cut is recommended. An interrupted cut may cause chipping or breakage.
- When using a Hydraulic or Shrink chuck, blow air to the arbor body, DON'T blow air to the endmill itself.
- A Minimum speed of 980 SFM is required. (Don't run at lower speed.)
- A 1.5 degree ramping angle is recommended. Run at 50% lower feed rate when ramping cut.

When cutting HRSA materials

- Continue to machine even if you see BUE, removing BUE may cause chipping or breakage to the edge.
- High speed machining work hardens the material. For this reason, leave at least 0.3mm of material for a finishing process.
